

Ergonomic workplace system

Correct workplace setup

Incorrectly designed workplaces not only decrease the quality and quantity of work performed. They can contribute to increased physical and psychological strain and thus to work-related employee illnesses.

The ergonomic design of workplaces can solve this problem. "Ergonomics" means adapting the work environment to the person. Correctly designed workplaces will contribute greatly to less fatiguing and relaxed work processes.

Complete workplace system

The new workplace system designed by Lehmann Präzision GmbH is used in the metal-processing industry, in the tool and mould production as well as in the clock industry or the production of jewellery. It consists of two components:

1. Manual grinding spindle TopSpin for the deburring, grinding, polishing an similar work on

small parts. Further information regarding this device is detailed in separate brochure.

2. Workplate made of solid beech wood. The side rests for the lower arms are designed to prevent health-hazardous strain on the wrists or the lower arms on the table edge. The protective hood made of plexiglass protects the user from airborne chips. Comfortable working conditions possible without protective glasses. The protective cover can be easily replaced if it is scratched.

A channel is integrated into the work plate, via which the chips can be continuously vacuumed off the work station. This leaves the workplace clear of dirt and dust at all times. Any commercial suction device can be connected via adapters.

We also offer customised solutions of high quality, such as upholstered and adjustable armrests, integrated lighting, magnifying lighting, vices or completely equipped work tables. Contact us!

Subject to technical modifications.
